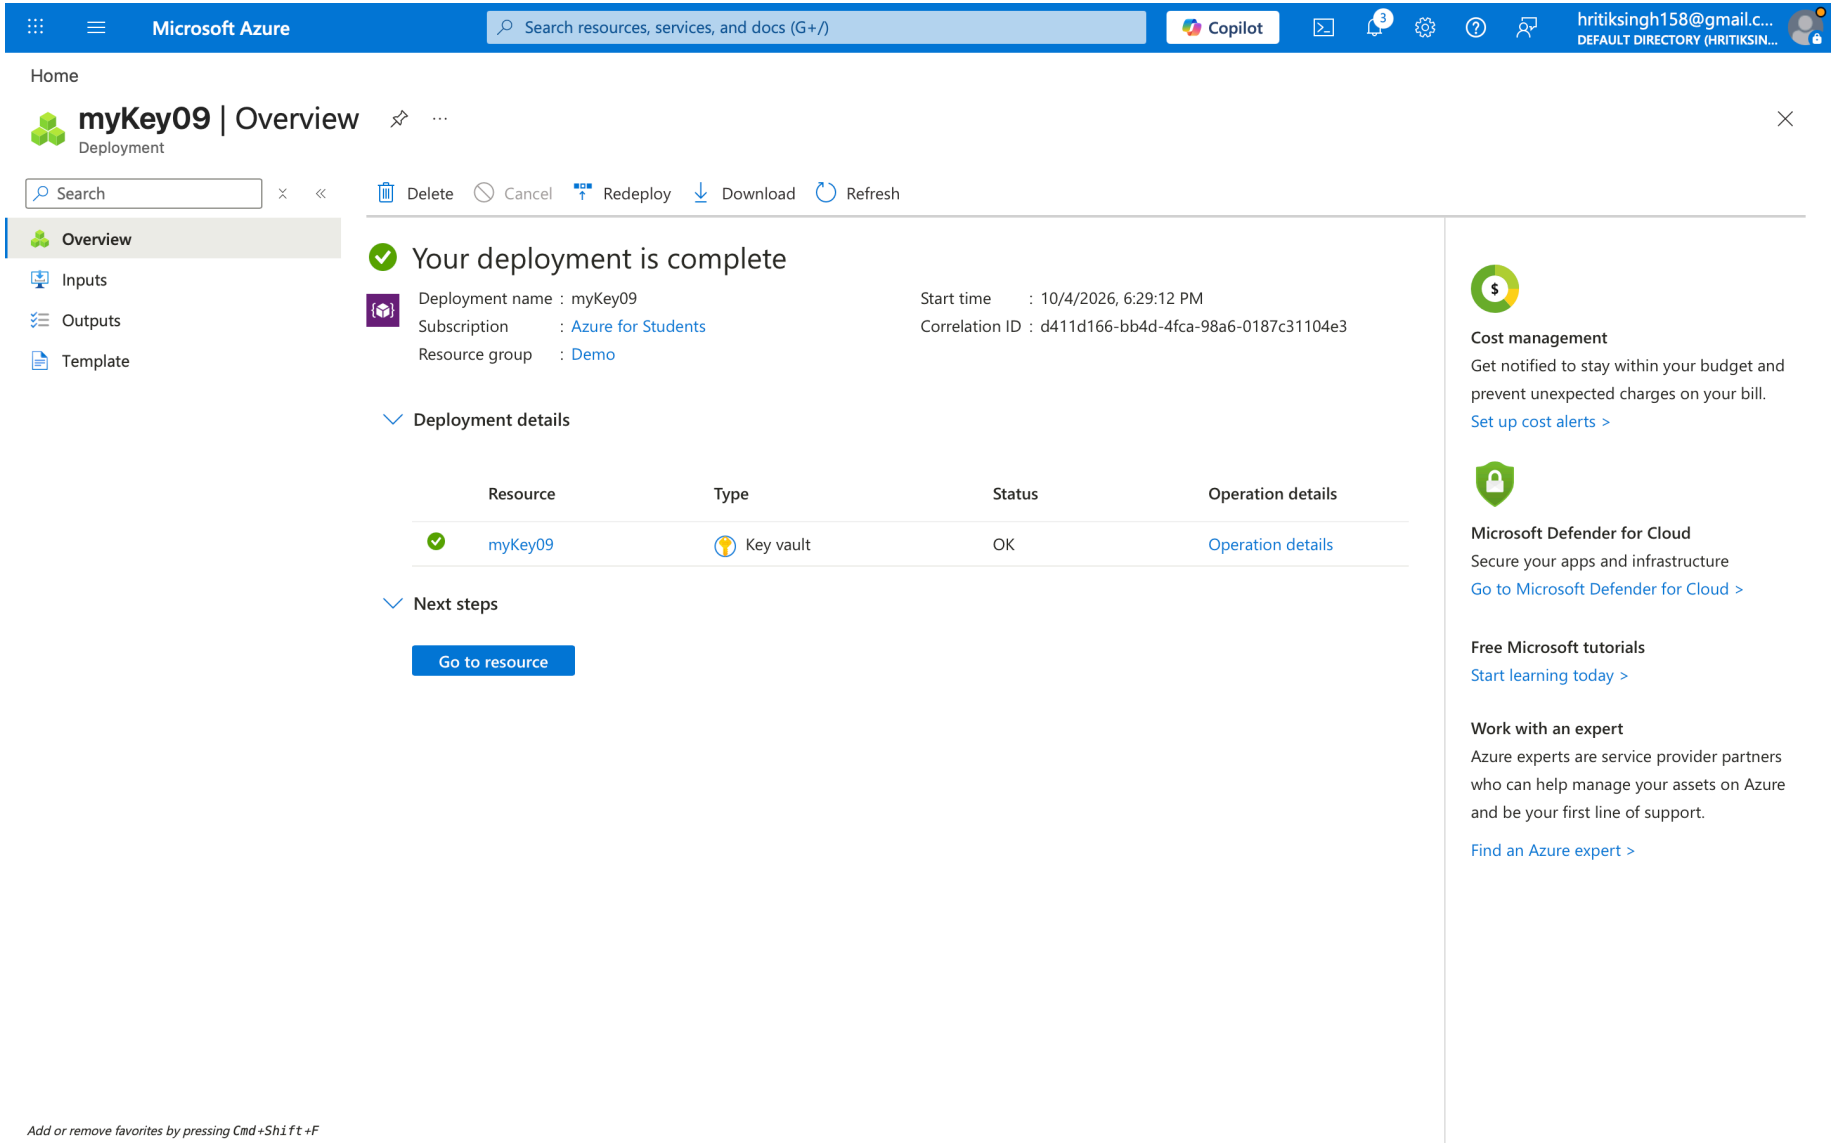
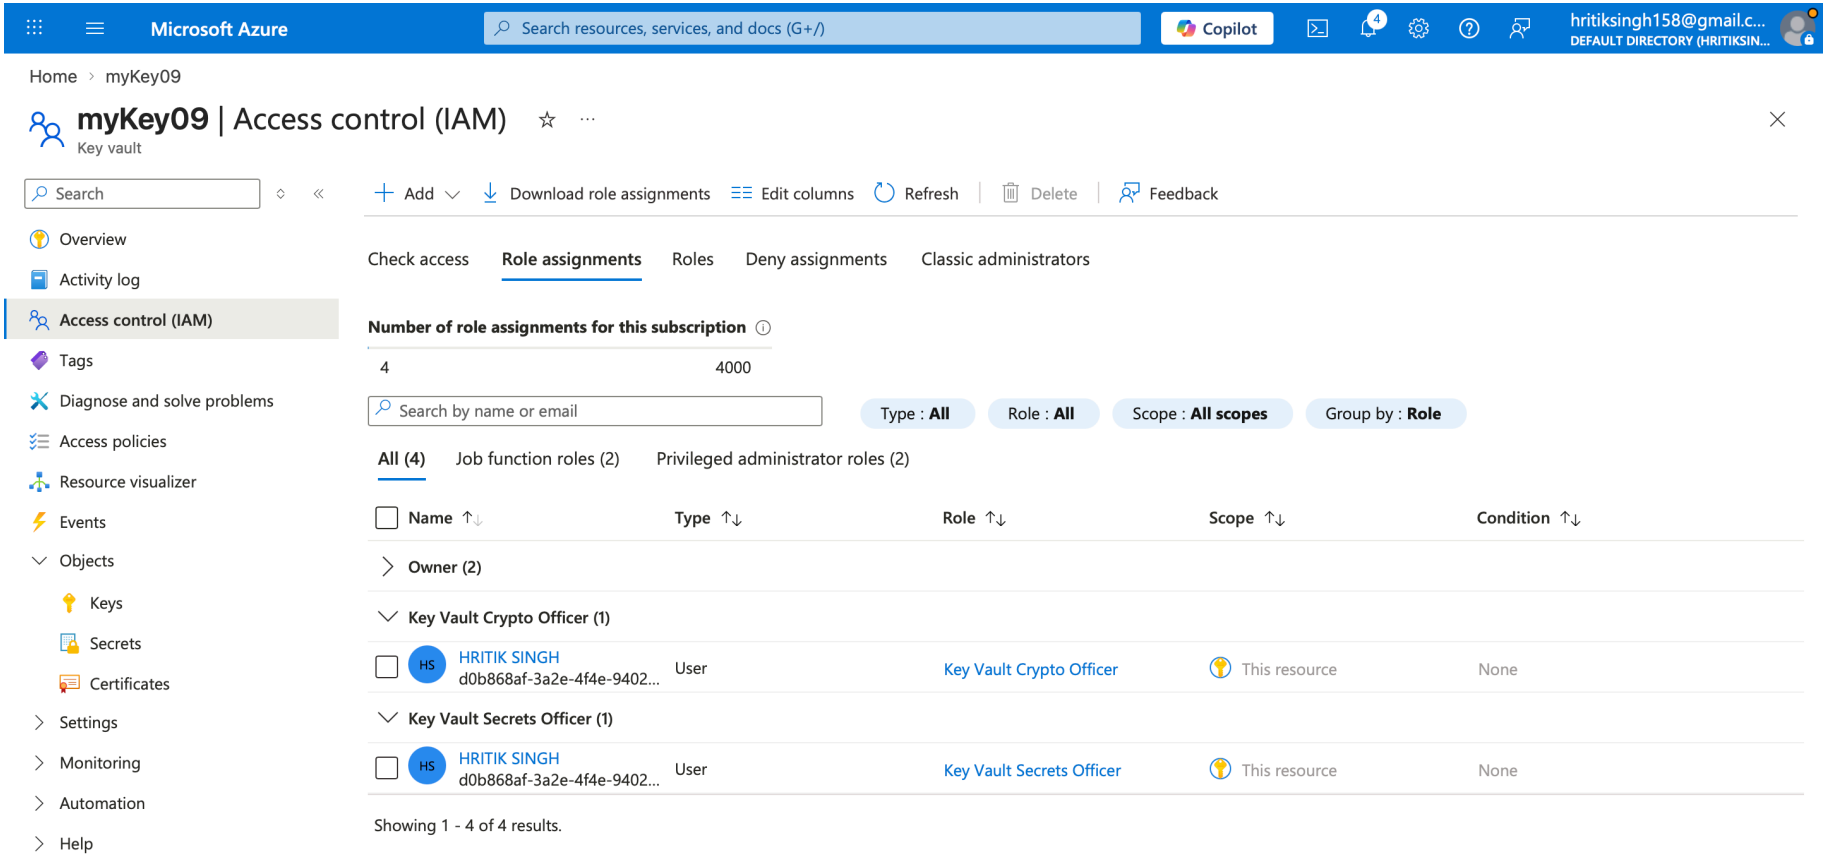
Part 1 : Creating Key Vault

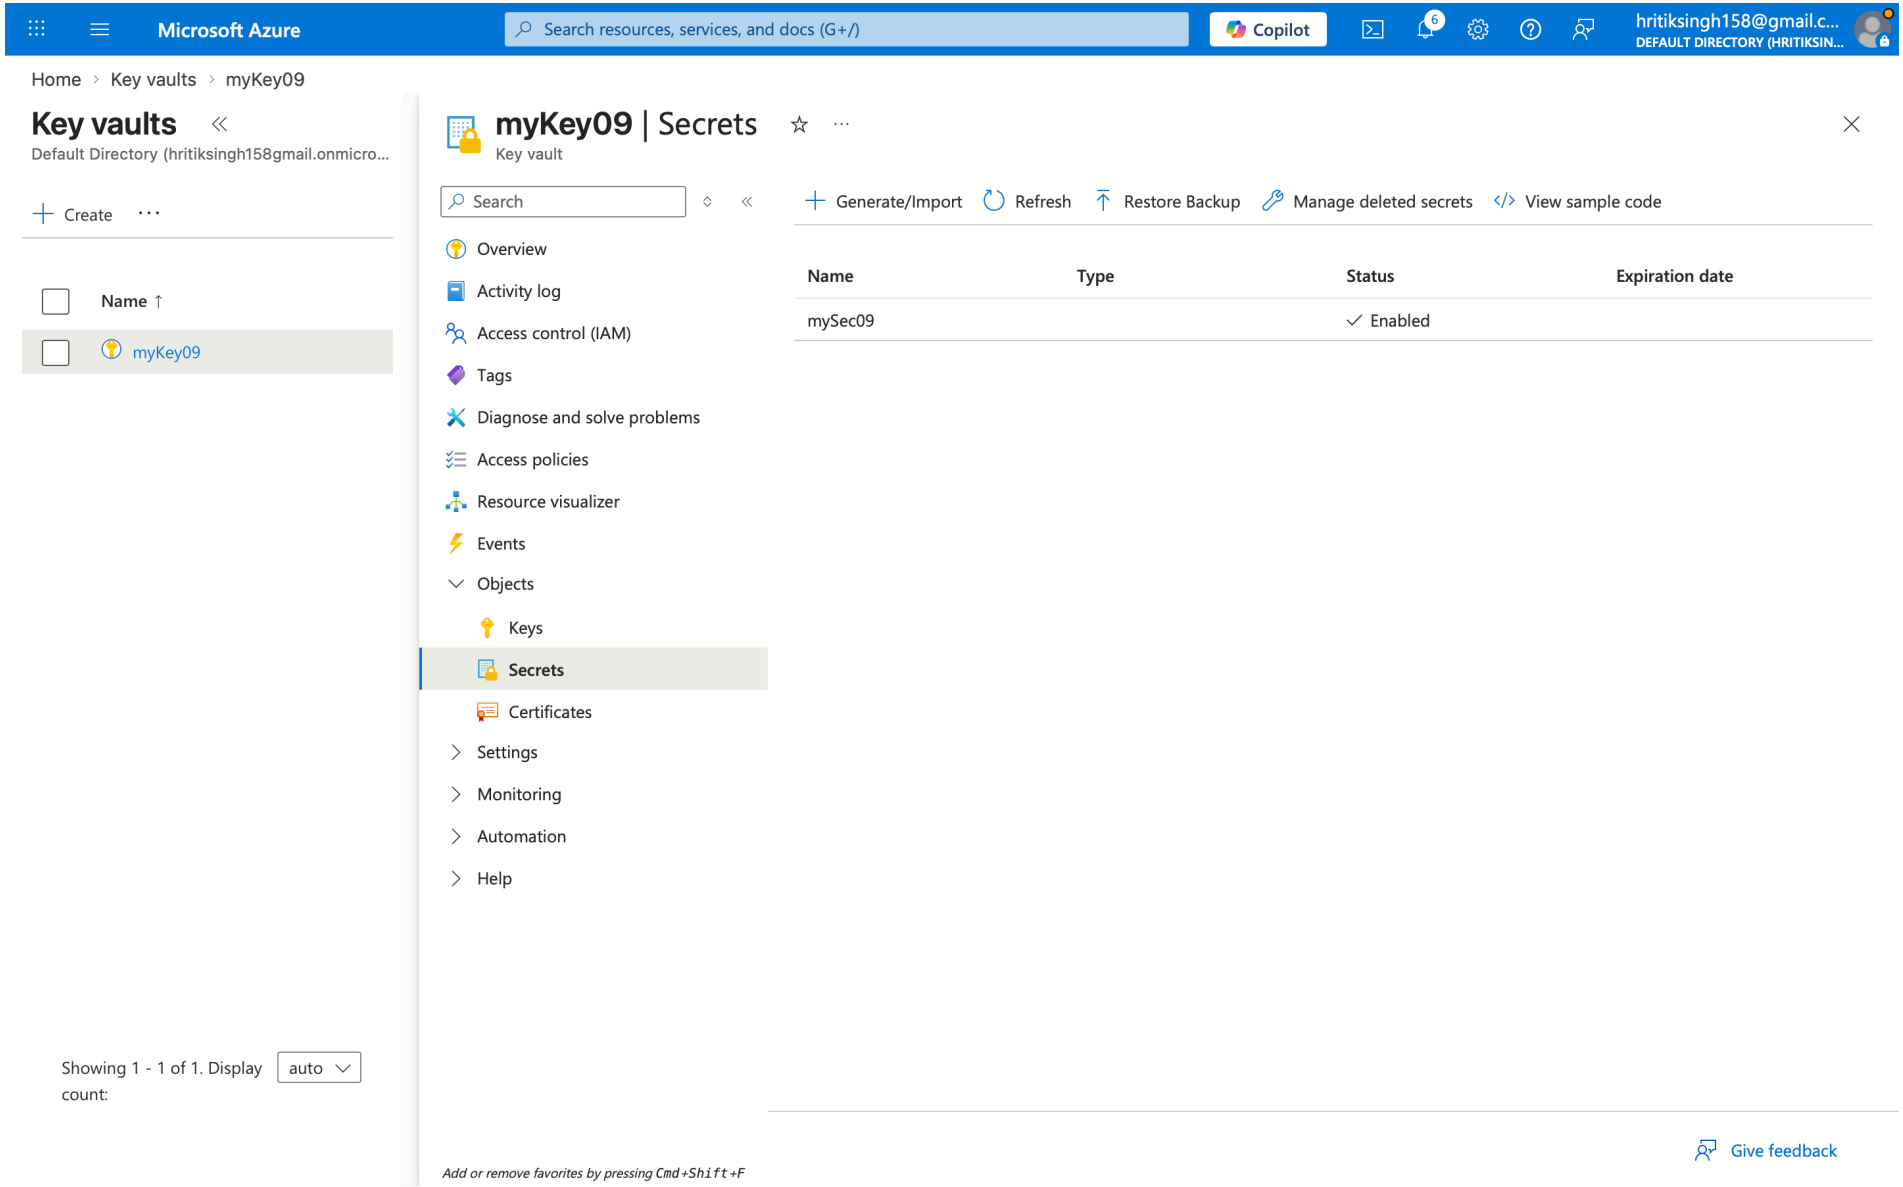


Part 2 : Assigning Roles

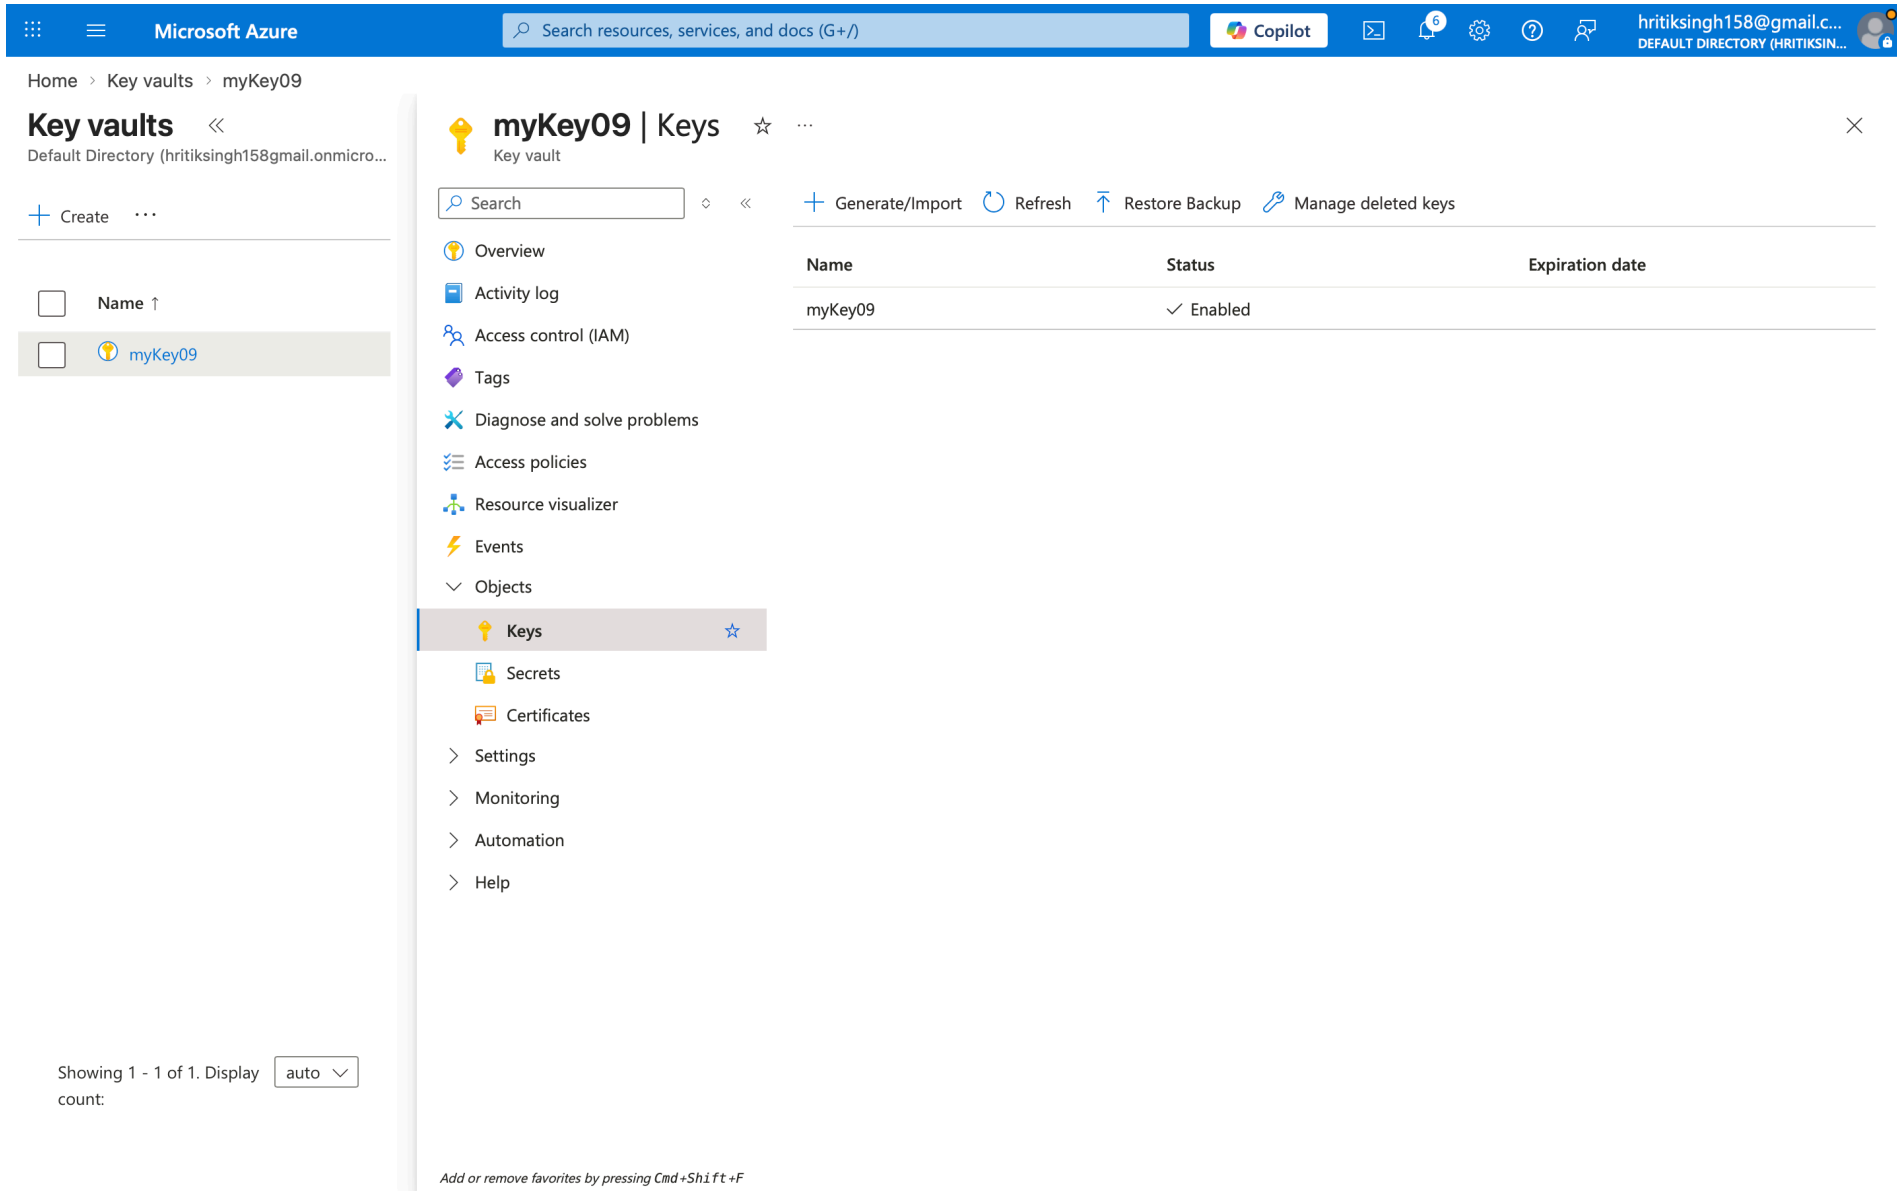


Add or remove favorites by pressing `Cmd+Shift+F`

Part 3 : Adding Secret



Part 4 : Creating Key



Part 5 : Testing Encryption and Decryption

Program.cs > { } Demo

```
using Azure.Identity;
using Azure.Security.KeyVault.Keys.Cryptography;
using System.Text;

namespace Demo
{

    0 references
    internal class DemoKey
    {
        0 references
        static void Main(string[] args)
        {
            string keyVaultUrl = "https://mykey09.vault.azure.net/";
            string keyName = "myKey09";

            var credential = new DefaultAzureCredential();

            var cryptoClient = new CryptographyClient(
                new Uri($"{keyVaultUrl}keys/{keyName}"),
                credential
            );

            string plainText = "Hello SmartBank!";
            byte[] data = Encoding.UTF8.GetBytes(plainText);
```
